

How to Run:

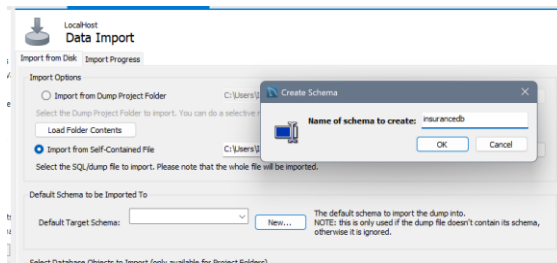

1. Install MySQL Server and MySQL Workbench
 - a. Follow installation tutorial: <https://www.mysqltutorial.org/getting-started-with-mysql/install-mysql/>
 - b. Password for root account will be used in step 2, store safely
2. Connect to MySQL server using root account
 - a. Tutorial: <https://www.mysqltutorial.org/getting-started-with-mysql/connect-to-mysql-server/>
 - b. Follow the directions of section “Connect to MySQL database server using MySQL Workbench”
 - c. Remember the “connection name” or “host name”
3. Import database
 - a. Once connected to MySQL Server, click “Server” on top bar and select “Data Import”

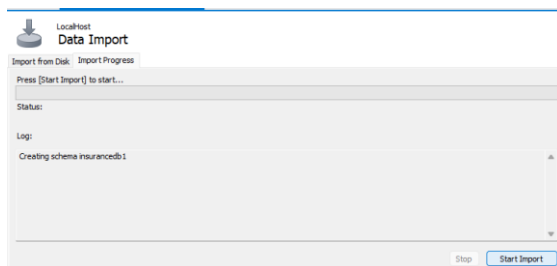

- b. Click “Import from Self-Contained file”. Then click the three dots to right and place our dump file to import (dump file found in “Db” folder in project)

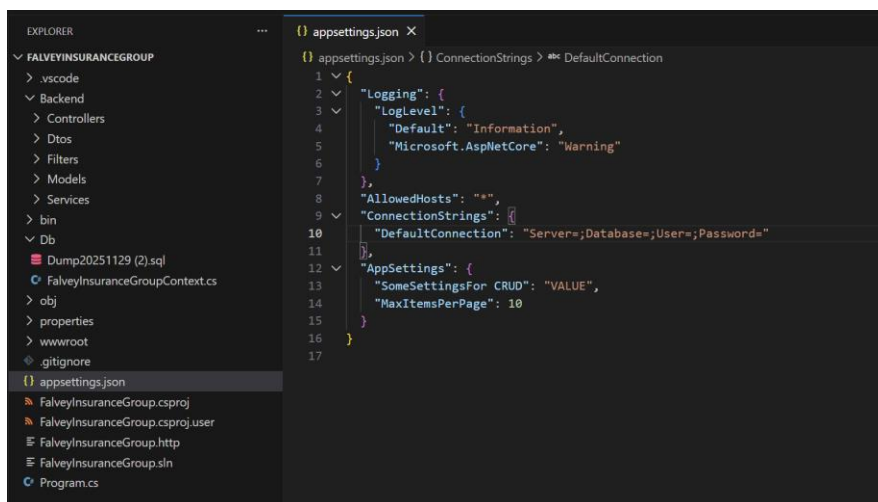

- c. Click “New...” to create a default schema (basically database) to import the dump into

- d. Import dump into new schema
 - a. Click “Import Progress” at top
 - b. Then click on “Start Import”

- c. Once import is complete without hiccups, go to step 4
4. Open Project and change database connection
 - a. Open Project and go to file “appsettings.json” to change “Default Connection”

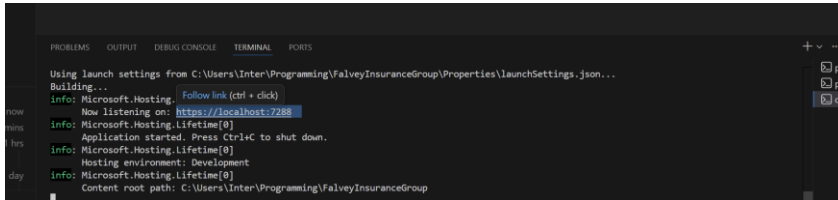

Server: Connection name or host name (what you typed or left when creating new connection from step 2)

Database: What you called the schema from step 3

User: root

Password: Password from step 1

5. Run project
 - a. Run project
 - b. If in VSCode, click here

```
PROBLEMS OUTPUT DEBUG CONSOLE TERMINAL PORTS
Using launch settings from C:\Users\Inter\Programming\FalveyInsuranceGroup\Properties\launchSettings.json...
Building...
Info: Microsoft.Hosting.Lifetime: Now listening on: https://localhost:7288
Info: Microsoft.Hosting.Lifetime: Application started. Press Ctrl+C to shut down.
Info: Microsoft.Hosting.Lifetime: Hosting environment: Development
Info: Microsoft.Hosting.Lifetime: Content root path: C:\Users\Inter\Programming\FalveyInsuranceGroup
```

- c. If using other IDE, just type the highlighted “https://localhost:7288” in browser URL
 - d. Leads to login page
6. Create user on Login/Signup page
 - a. Create a user, I suggest using Employee ID **1** (or any employee seeded in database)
 - b. Sign in as the account you created
 - c. Now you are logged in, have fun!

How to Run Edwin’s Map:

Edwin’s Map offers functionalities that do not appear in the product above. Another version that explores more user features like filtering and sorting locations

1. Open HTML file
 - a. Found in project folder wwwroot --> EdwinMap
 - b. Open index.html
2. JavaScript runs without needing all the steps in other version above
3. Have fun!
